Health

Results from Pathology

By Angelika Fischer

From an article in raum&zeit, Volume 43, Issue 254, March/April 2025

With great personal commitment, courageous pathologists examined deceased people who had received an mRNA Covid-19 vaccination in temporal connection with death. They recently published the well-founded documentation of their work. The results get under your skin.

Vaccine Damage Under the Microscope

To date, too little is known about what exactly the mRNA Covid-19 vaccinations have done to the body . The Federal Ministry of Health still states that the *"approved vaccines against COVID-19 offer effective protection against severe courses of the disease"*. And their benefits *"far outweigh any potential risks."* ⁽¹⁾ However, the clinics that specialize in the treatment of vaccine damage, such as the University Hospital Marburg, cannot cope with the large number of patients who want to seek help there.

Vaccine Side Effects

By March 2023, the **Paul-Ehrlich-Institute** (PEI) had collected a total of 340,282 reports of suspected cases of side effects and 56,432 reports of suspected cases of serious side effects after Covid-19 vaccinations in Germany. Although these figures must be seen in relation to the number of vaccinations administered (192,208,062), the Covid-19 vaccines however perform significantly worse compared to previous vaccinations, as the Organization of Doctors for Individual Vaccination Decisions (ÄFI) explains on its homepage. Therefore in percentage terms, there were strikingly more suspected cases of side effects and of serious side effects in the case of the novel vaccines.

The organization CoVerSE is committed for those people who have severe and persistent side effects after Covid 19 vaccinations. As a result under the term Post-Vac-Syndrome (PVS) it includes symptoms such as fatigue, cardiovascular and neurological complaints, which often appear a few weeks after vaccination and can persist for years.

CoVerSE estimates that in Germany alone there are more than 10,000, if not over 100,000 cases of PVS. According to the organization, there are likely to be over a million people affected worldwide.

The exact effects of the gene vaccines in the body have not yet been researched.

Causal Proof

Against this background, the number of 467 recognized vaccine injuries in Germany seems quite low. On closer inspection, this is no wonder, because in order to be recognized as vaccine damage, vaccinated people must provide full proof that the vaccination not only occurred in temporal connection with the damage to health, but is also causally responsible for it. This is very difficult to prove. Among other things, this is because gene vaccinations are also new territory for science and the exact effects of the vaccines in the body have not yet been researched.

The question here is also whether it is even desirable to officially research these effects and how could this be achieved?

The pathologist **Prof. Arne Burkhardt**, who has unfortunately died in the meantime, made a push here. While the government seemed to have no interest in commissioning pathologists to research the connections, Burkhardt, together with his colleagues **Prof. Walter Lang** and **Dr. Ute Krüger**, took responsibility for getting to the bottom of the causes of deaths during the Corona period.

Pathological Examinations

From March 2021 to June 2023, the scientists examined the autopsy material of 89 deceased and the biopsy material of 75 living people at Prof. Burkhardt's Institute of Pathology in Reutlingen. Their goal was always to find out whether there was a connection between the death or illness of the respective persons and mRNA vaccines against SARS-CoV-2. The bottom line is that their investigations proved that a link between vaccination and death or disease was likely, very likely or almost certain in 74 percent of cases.

At least as significant as this probability determination, however, were their findings on the pathogenic mechanism of action of the vaccinations. They substantiate the fears already spread from various directions that the mRNA vaccines cause massive damage throughout the body and completely throw the immune system out of control.

Documented Damage

Recently, a Histopathological Atlas was published, in which Lang and Krüger document the results using microscope images and factual descriptions. A large number of cases are systematically listed here with descriptions of medical history, corona vaccination, pathohistological findings, associated images and cause of death. As it corresponds to the routine of such examinations, the pathologists used certain staining techniques in order to be able to diagnose pathological changes with certainty. They also used immunohistochemical techniques to prove both the spike protein as well as the main structural protein of the virus "SARS-CoV-2 nucleocapsid".

In summary, they came to the following conclusion:

There are typical findings in deaths that are temporally related to Corona vaccinations.

- Tissue damage is striking, increasing with the number of vaccinations received.
- As a result the damage is not organ-specific, but in all organs, including the brain.
- Vessels were impaired in different ways: by inflammation of the vessel walls, atrophy of elastic fibers, cell death as well as water retention.
- In more than half of the cases, the cause of death was myocarditis, i.e. inflammation of the heart muscle,
- Spike proteins were often found in the blood and cell walls of blood vessels, especially capillaries, which are the small blood vessels. In these vascular wall areas, the pathologists often found dead cells of the vascular lining, which exfoliated into the interior of the vessel. Furthermore, they identified adhesions of thrombocytes, thus blood platelets, and the formation of thrombi, and consequently blood clots.
- Medium-sized and small blood vessels showed conspicuously frequent wall thickening, which restricted the blood supply.
- Furthermore, the pathologists found crystalline deposits in the heart muscle, pancreas, kidney, adrenal gland, lungs, liver or skeletal muscle in numerous cases

- In individual cases, a greatly reduced sperm formation was noticed.
- In their closing remarks, the authors pleaded that these connections should be further investigated and discussed. The dangers of mRNA vaccinations that have been identified so far should be taken seriously *"so as not to bring even more suffering to so many people."*

Angelika Fischer studied Modern German Literature (M.A.) in Munich, is a physiotherapist, alternative practitioner (psychotherapy) and dance therapist.
